Annual Drinking Water Quality Report 2015 CITY OF MANNINGTON, 206 MAIN STREET, MANNINGTON, WV 26582 MANNINGTON PSD, 307 East Main Street, Mannington, WV 26582 PWS# WV3302513 FLAGGY MEADOW / BINGAMON PWS# WV3302512 LOGANSPORT PWS# WV3302532

METZ PWS# WV3302536 April 12, 2016

Why am I receiving this report?

- In compliance with the Safe Drinking Water Act Amendments, the **Mannington PSD** is providing its customers with this annual water quality report. This report explains where your water comes from, what it contains, and how it compares to standards set by regulatory agencies. The information in this report shows the results of our monitoring for the period of January 1st to December 31st, 2015 or earlier if not on a yearly schedule.
- If you have any questions concerning this report, you may contact Dave Smith, Distribution Operator, 304-986-1010 Monday through Friday 8:00 AM 4:00 PM. If you have any further questions, comments or suggestions, please attend any of our regularly scheduled water board meetings held on the last Thursday of every month at 7:00 p.m. at the PSD office, 307 East Main Street, Mannington, WV. Where does my water come from?
- Your drinking water is **purchased** from the City of Fairmont which is **surface** water from the Tygart River.
- Source Water Assessment A Source Water Assessment was conducted by the West Virginia Bureau for Public Health (WVBPH). The intake that supplies drinking water to the **City Of Fairmont** has a higher susceptibility to contamination, due to the sen-sitive nature of surface water supplies and the potential contaminant sources identified within the area. This does not mean that this intake will become contaminated only that conditions are such that the surface water
- could be impacted by a potential contaminant source. Future contamination may be avoided by implementing protective measures. The source water assessment report which contains more information is available for review or a copy will be provided to you at our office during business hours or from the WVBPH 304-558-2981. Why must water be treated?

All drinking water contains various amounts and kinds of contaminants. Federal and state regulations establish limits, controls, and treatment practices to minimize these contaminants and to reduce any subsequent health effects

Contaminants in Water

- In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. FDA regulations establish limits of contaminants in bottled water which must provide the same protection for public health.
- Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of these contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline (800-426-4791).
- The source of drinking water (both tap and bottled water) includes rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of land or through the ground, it dissolves naturally-occur-ring minerals, and, in some cases radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations and wildlife.
- systems, agricultural livestock operations and wilding. **Inorganic contaminants**, such as salts and metals, which can be naturally-occurring, or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, farming. Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm water
- runoff, and residential uses Organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems.
- Radioactive contaminants, which can be naturally-occurring or the result of oil and gas production and mining activities
- Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have un-dergone organ transplants, people with HIV/AIDS or other immune disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (800-426-4791). Water Quality Data Table

Definitions of terms and abbreviations used in the table or report:

- · MCLG Maximum Contaminant Level Goal, or the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety. • MCL - Maximum Contaminant Level, or the highest level of a contaminant that is allowed in drinking water.
- MCLs are set as close to the MCLGs as feasible using the best available treatment technique.
- MRDLG Maximum Residual Disinfectant Level Goal, or the level of drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect benefits of use of disinfectants to control microbial contaminants.
- MRDL Maximum Residual Disinfectant Level, or the highest level of disinfectant allowed in drinking water. There is convincing evidence that addition of disinfectant is necessary to control microbial contaminants.
- · AL Action Level, or the concentration of a contaminant which, when exceeded, triggers treatment or other re-
- quirements which a water system must follow. TT - Treatment Technique, or a required process intended to reduce the level of a contaminant in drinking water
- Abbreviations that may be found in the table:

- ppm parts per million or milligrams per liter
 ppb parts per billion or micrograms per liter
 NTU Nephelometric Turbidity Unit, used to measure cloudiness in water

NE - not established
NA - not applicable
pCi/l -picocuries per liter

The **City Of Fairmont, City of Mannington and Mannington PSD** routinely monitors for contaminants in your drinking water according to federal and state laws. The tables below show the results of our monitoring for contaminants.

Table of Test Results - Re						
Contaminant	Violation Y/N		Unit of Measure	MCLG		kely Source of Contamination
Miceobiological Contamir	ants					
Turbidity	Ν	0.050 100 % of monthly sample <0.3	NTU	0	TT	Soil runoff
norganic Contaminants

		Range				
Site 1		15-70				
Site 2		32-90				
Site 3		13-66				
Site 4		19-58				

: * Copper and lead samples were collected from 30 Fairmont area residences, and 5 Rayford Acres area residences on September 5, 2013. Only the 90th percentile is reported. None of the samples collected exceeded the MCL

The Fairmont Water Board conducted monitoring of contaminants included in the unregulated contaminate moni-toring rule 3 (UCMR3) 2013 issued by the USEPA. Unregulated contaminants are those that don't yet have a drinking water standard set by USEPA. The purpose of monitoring these contaminants is to help EPA decide whether the contaminants should have a standard. The Fairmont Water Board tested for 30 contaminants, only 4 contaminants was detected. The mandated test sites are the effluent from the water treatment plant and the MRT (Maximum Residence Time). The four contaminants are grouped accordingly.

WE ARE PLEASED TO REPORT THAT THE MANNINGTON PSD, CITY OF MANNINGTON AND THE FAIR-MONT WATER BOARD MET ALL FEDERAL AND STATE WATER STANDARDS FOR THE REPORTING YEAR 20145 YEAR 20145

Additional Information

All other water test results for the reporting year 2015 were all non-detects.

fit present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The Mannington PSD, City of Mannington, and The Fairmont Water Board are responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing compo-nents. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your drinking water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead. This report will not be mailed. A copy will be provided to you upon request at our office during regular business hours. Times: April 18, 2016
